

Germ-busting in Schools

What are the germiest surfaces?

The surfaces that are most likely to spread germs, are surfaces that are used by more than one person. This often includes:

- **Desks and Tables** – Students and staff spend most of the day at a desk. All sneezes, coughs, and dirt from hands land on desks.
- **Door Handles** – Door handles are touched a lot throughout a day!
- **Sinks** – Sinks collect bacteria from dirty hands.

What other surfaces need cleaning often?

Every school has surfaces that are touched by many students in a day. Bacteria, viruses, and other germs can live for days to months on these high touch surfaces. The good news is that with daily* cleaning and disinfecting, you can break the Chain of Infection and reduce risk of infection at your school!

High touch surfaces may include:

Desks

Bathroom seats and taps

Sinks and taps

Play equipment

Frequently touched light switches and railings

Shared items
(white board markers,
toys, learning tools)

Doorknobs & door handles

Water fountains and
water bottle filling stations

*More frequent cleaning and disinfection may be needed depending on the frequency of use and extent of soilage.

What else can I do to prevent the spread of illness?

Practicing good hand hygiene, respiratory etiquette and staying home when you are unwell are simple ways to reduce the spread of germs and break a link in the Chain of Infection!
